
The new 5-in-1 KR-800S features the very latest in auto-refraction technology, incorporating Topcon’s proven Rotary Prism technology for unparalleled accuracy and consistent measurements. It adds on Subjective Visual Acuity testing, allowing you to refine a patient’s measurements. The KR-800S features several new tests including a visual acuity (VA) check for near and far distance, a contrast sensitivity test, a grid test, and glare testing, that can be utilized to assess a patient’s visual acuity under glare conditions. This is especially important for a patient who may be a candidate for cataract surgery or who complains of poor nighttime vision.

The KR-800S also features a compact and user-friendly design with a 8.5” color touchscreen display that provides quick and accurate readings with minimal training required.

“The new KR-800S combines the very latest in auto-refraction technology with the added benefit of subjective visual acuity testing, making it the ideal instrument for any practice,” summarized Robert Gibson, Vice President of Marketing for TMS.
